

# Eliminate bottlenecks and reduce delays with the SAFe® Value Stream Mapping Workshop

*Value stream maps are powerful tools for visualizing end-to-end delivery processes, measuring performance against business objectives, and locating hidden causes of delay.*

A Value Stream represents a set of activities an organization executes to deliver a solution to the customer, from initiation through value realization. There are often hidden bottlenecks or delays in the value streams that prevent organizations from achieving business results.

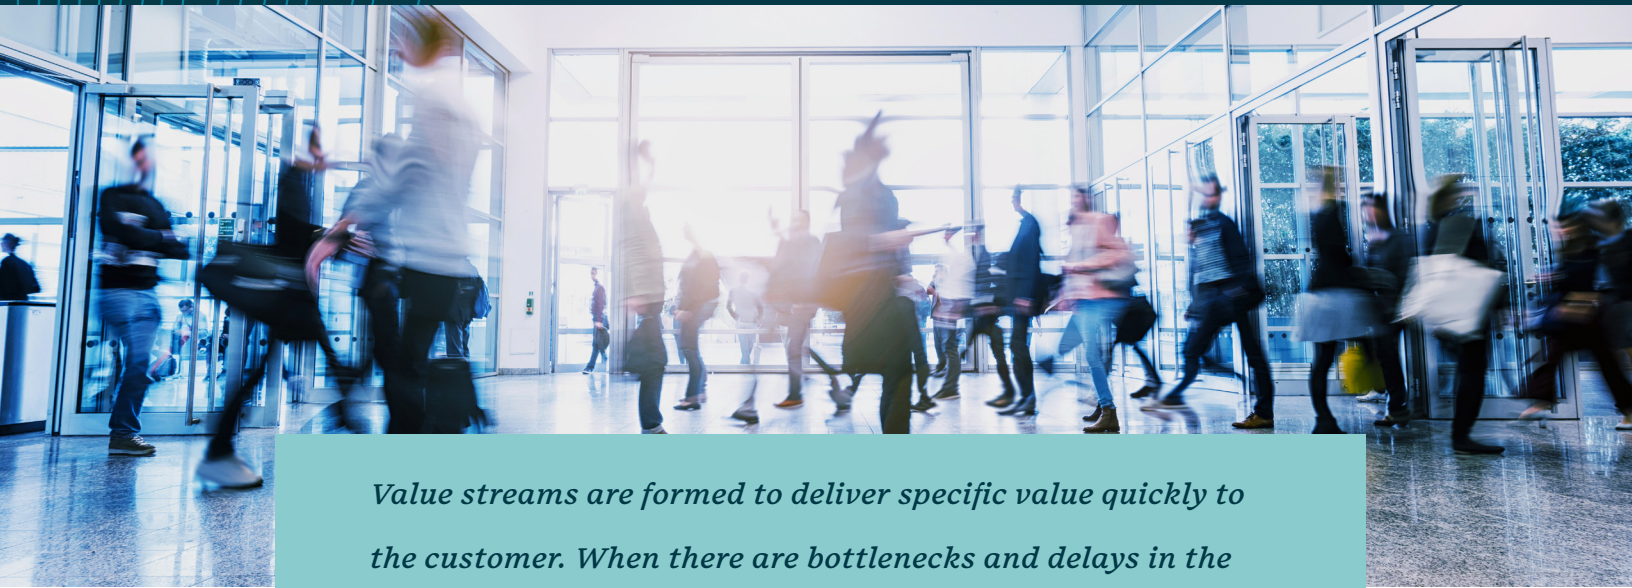

To reduce the time from ideation until a new product or solution is in the hands of the customer and to achieve high-quality business outcomes, an organization must raise awareness around the causes of delay, and enable alignment and transparency.

The SAFe Value Stream Mapping Workshop is a facilitated, collaborative workshop that helps you measure the health of your current value stream, identify the biggest bottlenecks, and arrive at an actionable plan to optimize your Value stream.

## Through the Value Stream Mapping Workshop, you'll discover how to:

- Gain alignment on the current state of your value stream
- Measure speed, quality and the efficiency of your value stream
- Identify the biggest bottlenecks hindering value delivery
- Create an actionable improvement plan

# Optimize value delivery with the SAFe® Value Stream Mapping Workshop

*Value streams are formed to deliver specific value quickly to the customer. When there are bottlenecks and delays in the system, that value is compromised.*

The SAFe Value Stream Mapping Workshop is a powerful tool that leverages collaboration and visualizes the relationship between operational and technical components of value delivery. Alignment and transparency are supported through a shared understanding of how value is created and delivered to your end customers. The workshop also influences leadership thinking by helping them see that eliminating the functional silos while removing the bottlenecks and delays will improve the ability to

deliver customer value, exceed business objectives and capitalize on market opportunities.

Value streams may already exist in your organization. Find out what work may have been done in these existing value streams with your business or Enterprise Architect, and then schedule a Value Stream Mapping Workshop with your SAFe Practice Consultant (SPC).
